Go to node js website → download page → pre-built installer → download the latest version.

Run the downloaded installer.

Create a folder called "form-handling-example" on the desktop.

Open this folder in VS Code.

Now create the following in form-handling-example folder:

Form-handling-example → public (folder) → style.css (file)

Form-handling-example → views (folder) → index.html (file)

Form-handling-example → app.js (file)

After typing the code for each file and saving each file, open a new terminal in VS code (make sure that the terminal opens in the form-handling-example folder).

Type the following commands in the terminal:

node -v

npm -v

npm init -y

npm install express

To Run the project:

node app.js

Open your browser and navigate to `http://localhost:3000`. You will see a form with a background color applied from the external CSS.

Submit the form, and you should see a confirmation page displaying the form data.
